

# Maze PA Explanation

Mark Redekopp

- Consider this maze
  - -S = Start
  - -F = Finish
  - . = Free
  - -# = Wall
- Find the shortest path

(0,0)	(0,1)	(0,2)	(0,3)
•	•	•	·
S 1,0)		F	(1,3) #
(2,0)	(2,1) #	(2,2)	(2,3)
(3,0)	(3,1)	(3,2)	(3,3) #

- To find a (there might be many) shortest path we use a breadth-first search (BFS)
- BFS requires we visit all nearer squares before further squares
  - A simple way to meet this requirement is to make a square "get in line" (i.e. a queue) when we encounter it
  - We will pull squares from the front to explore and add new squares to the back of the queue

Maze array:

(0,0)	(0,1)	(0,2)	(0,3)
			•
(1,0) S		F	(1,3) #
(2,0)	(2,1)	(2,2)	(2,3) #
(3,0)	(3,1)	(3,2)	(3,3) #

Queue

 We start by putting the starting location into the queue Maze array:

(0,0)	(0,1)	(0,2)	(0,3)
			•
(1,0) S	(1,1) #	(1,2)	(1,3) #
(2,0)	(2.1)	(2,2)	
	#		(2,3) #
(3,0)	(3,1)	(3,2)	(3,3)
١.	•		#

### Queue

- We start by putting the starting location into the queue
- Then we enter a loop...while the queue is not empty
  - Extract the front location, call it "curr"
  - Visit each neighbor (N,W,S,E) one at a time
  - If the neighbor is the finish
    - Stop and trace backwards
  - Else if the neighbor is a valid location and not visited before
    - Then add it to the back of the queue
    - Mark it as visited so we don't add it to the queue again
    - Record its predecessor (the location [i.e. curr] that found this neighbor

### Maze array:

(0,0)	(0,1)	(0,2)	(0,3)
		·	•
(1,0) S	(1,1) #	(1,2)	(1,3) #
(2,0)	(2,1) #	(2,2)	(2,3)
(3,0)	(3,1)	(3,2)	(3,3) #

### Queue

## Need to Do

### Queue class

- Make internal array to be of size= max number of squares
- Should it be dynamic?
- We need to keep track of the "front" and "back" since only a portion of the array is used
- Just use integer indexes to record where the front and back are

### Maze array:

(0,0) *	(0,1) *	(0,2) *	(0,3)
(1,0) S		(1,2)	(1,3) #
(2,0)	(2,1) #	(2,2)	(2,3)
(3,0)	(3,1)	(3,2)	(3,3) #

curr = 0,2

curr = pred[curr]

### Queue

1,0			

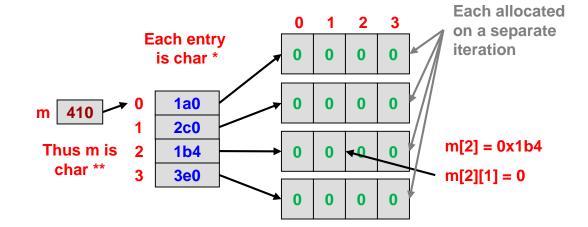

## Need to Do

 Allocate 2D arrays for maze, visited, and predecessors

Maze array:

- Note: in C/C++ you cannot allocate a 2D array with variable size dimensions
  - BAD: new char[numrows][numcols];
- Solution:
  - Allocate 1 array of NUMROW pointers
  - Then loop through that array and allocate an array of NUMCOL items and put its start address into the i-th array you allocated above

(0,0) *	(0,1) *	(0,2) *	(0,3)
(1,0) S		(1,2)	(1,3) #
(2,0)	(2,1) #	(2,2)	(2,3)
(3,0)	(3,1)	(3,2)	(3,3) #

## **BACKUP**

## Maze Solver

- To find a (there might be many) shortest path we use a breadth-first search (BFS)
- BFS requires we visit all nearer squares before further squares
  - A simple way to meet this requirement is to make a square "get in line" (i.e. a queue) when we encounter it
  - We will pull squares from the front to explore and add new squares to the back of the queue

Maze array:

(0,0)	(0,1)	(0,2)	(0,3)
		•	
(1,0) S	(1,1) #	(1,2)	(1,3) #
(2,0)	(2,1) #	(2,2)	(2,3)
